

VEGETATED

# SOPRANATURE® MODULAR SYSTEM

## ROOFS

### VEGETATED MODULE

SOPRANATURE modular systems are ideal for extensive and semi-intensive vegetated roof designs. The module features built-in irrigation channels, maximizing stormwater retention. These engineered channels within the module also allow air flow throughout, mitigating wind uplift and supplying air circulation and needed oxygen to the plants' root system. In addition, these channels accommodate irrigation supply lines for all types of irrigation systems, either during or post installation.

- Built-in channels provide air flow and accessible irrigation
- Deep reservoirs improve enhance stormwater retention
- Side wall gussets add strength to the modules

### SOPRANATURE MODULE WITH DEPTH EXTENDER INSERTS

The standard modules measure 1 ft x 2 ft x 4 in, and optional perforated extension walls add 2-4 inches of depth, increasing the system depth to either 6 or 8 inches. SOPRANATURE modular systems are engineered to address long-term plant health, practicality of installation and maintenance, as well as roof design considerations.

- Lock-in-place inserts make installation easy and secure
- Multiple media depths provide design flexibility
- Perforated side walls yield better plant health
